Simple CMS to integrate in a NextJS Project for blogs

CLAUDE SONNET

Here's a fully interactive CMS dashboard built for a Next.js blog — click any post to edit, use "+ New post" to create, and the delete button appears when editing an existing one.

NextJS Integration — file-based, no database needed

File structure:

/content/posts/	← your markdown files live here
/src/lib/posts.ts	← read/parse helpers
/src/app/api/posts/	← CRUD API routes
/src/app/admin/	← mount the CMS UI here

src/lib/posts.ts — read all posts:

```
import fs from 'fs'
import path from 'path'
import matter from 'gray-matter'

const postsDir = path.join(process.cwd(), 'content/posts')

export function getAllPosts() {
  return fs.readdirSync(postsDir)
    .filter(f => f.endsWith('.md'))
    .map(file => {
      const raw = fs.readFileSync(path.join(postsDir, file), 'utf8')
      const { data, content } = matter(raw)
      return { slug: file.replace('.md', ''), content, ...data }
    })
    .sort((a, b) => new Date(b.date) - new Date(a.date))
}

export function getPost(slug: string) {
  const raw = fs.readFileSync(path.join(postsDir, `${slug}.md`), 'utf8')
  const { data, content } = matter(raw)
  return { slug, content, ...data }
}
```

src/app/api/posts/route.ts — save a post:

```
import fs from 'fs'
import path from 'path'
import matter from 'gray-matter'
import { NextResponse } from 'next/server'

export async function POST(req: Request) {
  const { title, slug, excerpt, content, tags, status, date } = await req.json()
  const frontmatter = matter.stringify(content, { title, excerpt, tags, status, date })
  fs.writeFileSync(path.join(process.cwd(), 'content/posts', `${slug}.md`), frontmatter)
  return NextResponse.json({ ok: true })
}
```

```
}

export async function DELETE(req: Request) {
  const { slug } = await req.json()
  fs.unlinkSync(path.join(process.cwd(), 'content/posts', `${slug}.md`))
  return NextResponse.json({ ok: true })
}
```

content/posts/my-first-post.md — a post file looks like:

```
---
title: My First Post
excerpt: Short description here
tags: [nextjs, react]
status: published
date: 2025-05-02
---

## Hello World

Your markdown content here.
```

Install dependency:

```
npm install gray-matter
```

Key points

- The CMS admin panel (/src/app/admin) calls your API routes for save/delete.
- Protect /admin with NextAuth or middleware so it is not publicly accessible.
- For production, swap the filesystem layer for a DB (PlanetScale, Supabase) — the API contract stays identical.
- `revalidatePath('/')` in your API routes triggers ISR so posts go live instantly without rebuilds.
